**REG NO: 241801161**

## **GREEDY ALGORITHMS**

### **PROGRAM 1:**

Question 1 | Correct Mark 1.00 out of 1.00 [Flag question](#)

Write a program to take value V and we want to make change for V Rs, and we have infinite supply of each of the denominations in Indian currency, i.e., we have infinite supply of { 1, 2, 5, 10, 20, 50, 100, 500, 1000} valued coins/notes, what is the minimum number of coins and/or notes needed to make the change.

Input Format:

Take an integer from stdin.

Output Format:

print the integer which is change of the number.

Example Input :

64

Output:

4

Explanation:

We need a 50 Rs note and a 10 Rs note and two 2 rupee coins.

**Answer:** (penalty regime: 0 %)

```
1 #include <stdio.h>
2 int main()
3 {
4     int V;
5     scanf("%d", &V);
6     int denominations[] = {1000, 500, 100, 50, 20, 10, 5, 2, 1};
7     int n = sizeof(denominations) / sizeof(denominations[0]);
8     int count = 0;
9     for (int i = 0; i < n; i++)
10    {
11        if (V >= denominations[i])
12        {
13            count += V / denominations[i];
14            V = V % denominations[i];
15        }
16    }
17
18    printf("%d\n", count);
19
20 }
```

	Input	Expected	Got

## PROGRAM 2:

Question 1 | Correct Mark 1.00 out of 1.00 [Flag question](#)

Assume you are an awesome parent and want to give your children some cookies. But, you should give each child at most one cookie.

Each child  $i$  has a greed factor  $g[i]$ , which is the minimum size of a cookie that the child will be content with; and each cookie  $j$  has a size  $s[j]$ . If  $s[j] \geq g[i]$ , we can assign the cookie  $j$  to the child  $i$ , and the child  $i$  will be content. Your goal is to maximize the number of your content children and output the maximum number.

**Example 1:**

**Input:**

3

1 2 3

2

1 1

**Output:**

1

Explanation: You have 3 children and 2 cookies. The greed factors of 3 children are 1, 2, 3.

And even though you have 2 cookies, since their size is both 1, you could only make the child whose greed factor is 1 content.

You need to output 1.

**Constraints:**

$1 \leq g.length \leq 3 * 10^4$

$0 \leq s.length \leq 3 * 10^4$

$1 \leq g[i], s[j] \leq 2^{31} - 1$

**Answer:** (penalty regime: 0 %)

```
1 #include <stdio.h>
2 #include <stdlib.h>
3
4 int cmp(const void *a, const void *b)
5 {
6     int x = *(int*)a;
7     int y = *(int*)b;
8     return (x-y);
9 }
10
11 int main() {
12     int n, m;
13     scanf("%d", &n);
14     int g[n];
15     for (int i = 0; i < n; i++)
16     {
17         scanf("%d", &g[i]);
18     }
19     scanf("%d", &m);
20     int s[m];
21     for (int i = 0; i < m; i++)
22     {
23         scanf("%d", &s[i]);
24     }
25     qsort(g, n, sizeof(int), cmp);
26     qsort(s, m, sizeof(int), cmp);
27     int i = 0, j = 0;
28     int content_children = 0;
29     while (i < n && j < m)
30     {
31         if (s[j] >= g[i])
32         {
33             content_children++;
34             i++;
35             j++;
36         }
37         else
38         {
39             j++;
40         }
41     }
42     printf("%d\n", content_children);
43     return 0;
44 }
```

Correct

Marks for this submission: 1.00/1.00.

# PROGRAM 3:

Question 1 | Correct Mark 1.00 out of 1.00 ⚡ [Flag question](#)

A person needs to eat burgers. Each burger contains a count of calorie. After eating the burger, the person needs to run a distance to burn out his calories. If he has eaten  $i$  burgers with  $c$  calories each, then he has to run at least  $3^i * c$  Kilometers to burn out the calories. For example, if he ate 3 burgers with the count of calorie in the order: [1, 3, 2], the kilometers he needs to run are  $(3^0 * 1) + (3^1 * 3) + (3^2 * 2) = 1 + 9 + 18 = 28$ . But this is not the minimum, so need to try out other orders of consumption and choose the minimum value. Determine the minimum distance he needs to run. Note: He can eat burger in any order and use an efficient sorting algorithm. Apply greedy approach to solve the problem.

## Input Format

First Line contains the number of burgers

Second line contains calories of each burger which is  $n$  space-separate integers

## Output Format

Print: Minimum number of kilometers needed to run to burn out the calories

## Sample Input

3

5 10 7

## Sample Output

76

## For example:

Test	Input	Result
Test Case 1	3 1 3 2	18

**Answer:** (penalty regime: 0 %)

```
1 #include<stdio.h>
2 #include<stdlib.h>
3 #include<math.h>
4 int cmp_desc(const void *a, const void *b)
5 {
6     return (*(int*)b - *(int*)a);
7 }
8
9 int main() {
10     int n;
11     scanf("%d", &n);
12     int a[n];
13     for (int i = 0; i < n; i++) {
14         scanf("%d", &a[i]);
15     }
16     qsort(a, n, sizeof(int), cmp_desc);
17     int c=0;
18     for(int i=0;i<n;i++)
19     {
20         c+=(pow(n,i)*a[i]);
21     }
22     printf("%d",c);
23 }
```

	Test	Input	Expected	Got

Passed all tests! ✓

**Correct**

Marks for this submission: 1.00/1.00.

## PROGRAM 4:

Question 1 | Correct Mark 1.00 out of 1.00 [Flag question](#)

Given an array of N integer, we have to maximize the sum of arr[i] \* i, where i is the index of the element (i = 0, 1, 2, ..., N). Write an algorithm based on Greedy technique with a Complexity O(nlogn).

Input Format:

First line specifies the number of elements-n

The next n lines contain the array elements.

Output Format:

Maximum Array Sum to be printed.

Sample Input:

5

2 5 3 4 0

Sample output:

40

**Answer:** (penalty regime: 0 %)

```
1 #include<stdio.h>
2 #include<stdlib.h>
3 int cmp(const void *a, const void *b)
4 {
5     return (*(int*)a - *(int*)b);
6 }
7
8 int main()
9 {
10    int n;
11    scanf("%d",&n);
12    int a[n],sum=0;
13    for(int i=0;i<n;i++)
14    {
15        scanf("%d",&a[i]);
16    }
17    qsort(a,n,sizeof(int),cmp);
18    for(int i=0;i<n;i++)
19    {
20        sum+=a[i]*i;
21    }
22    printf("%d",sum);
23 }
24 }
```

	Input	Expected	Got	
✓	5 2 5 3 4 0	40	40	✓
✓	10 2 2 2 4 4 3 3 5 5 5	191	191	✓
✓	2 45 3	45	45	✓

Passed all tests! ✓

Correct

Marks for this submission: 1.00/1.00.

## PROGRAM 5:

Question 1 | Correct Mark 1.00 out of 1.00 [Flag question](#)

Given two arrays array\_One[] and array\_Two[] of same size N. We need to first rearrange the arrays such that the sum of the product of pairs( 1 element from each) is minimum. That is SUM (A[i] \* B[i]) for all i is minimum.

For example:

Input	Result
3	28
1	
2	
3	
4	
5	
6	

**Answer:** (penalty regime: 0 %)

```
1 #include<stdio.h>
2 #include<stdlib.h>
3 int asc(const void *a, const void *b)
4 {
5     return (*(int*)a - *(int*)b);
6 }
7 int desc(const void *a, const void *b) {
8     return (*(int*)b - *(int*)a);
9 }
10 int main()
11 {
12     int n;
13     scanf("%d",&n);
14     int a[n],b[n],sum=0;
15     for(int i=0;i<n;i++)
16     {
17         scanf("%d",&a[i]);
18     }
19     for(int i=0;i<n;i++)
20     {
21         scanf("%d",&b[i]);
22     }
23     qsort(a,n,sizeof(int),asc);
24     qsort(b,n,sizeof(int),desc);
25     for(int i=0;i<n;i++)
26     {
27         sum+=a[i]*b[i];
28     }
29     printf("%d",sum);
30 }
```

	<b>Input</b>	<b>Expected</b>	<b>Got</b>
